TITLE : COMPUTER SYSTEM

ABSTRACT : PROBLEM TO BE SOLVED: To transmissively execute data transition among storage devices to host computers in a computer system, in which plural host computers are connected with plural storage devices.

SOLUTION: A back-end server 3 provides a host 1 having a virtual disk. The virtual disk first appears to be same as an old storage device sub-system 2 to the host 1. When data is transited from the old storage device sub-system 2 to a new storage device sub-system 2, the back-end server 3 first instructs a data transition processing to the new storage device sub-system 2, and after that, switches setting of the virtual disk and makes it correspond to the new storage device sub-system 2. Data transition among the disk devices is performed transmissively to the host 1, since this switching is transmissively executed to the host 1.
